Figure S1: Distributions of sequence lengths for targets in training set (blue) and test set (red).

Table S1: Closest homolog sequences from the training set. A sequence pair is reported if at least one training sequence aligns to a test sequence with a blastp E-value less than 10^{-4}. Only the top alignment is reported for each test sequence.

Test set ID	Closest training set ID	E-value
T0768	T0690	2.70×10^{-13}
T0770	T0645	1.79×10^{-13}
T0772	T0518	1.89×10^{-7}
T0776	T0707	3.98×10^{-5}
T0783	T0699	1.19×10^{-22}
T0798	T0308	9.57×10^{-6}
T0813	T0398	2.45×10^{-5}
T0819	T0636	8.66×10^{-15}
T0854	T0324	2.13×10^{-13}

Table S2: Targets from test and training sets that belong to the same Pfam family [2], based on a HMMER search [1] with an E-value cutoff of 1.0. With that cutoff, 403 of the 564 training targets and 65 of the 83 test targets could be assigned families. There are 25 families containing at least one test sequence and one training sequence, involving a total of 16 test targets and 42 training targets. Each of the 25 families belongs to a distinct Pfam clan.

Common family	Test set target	Training set targets

Figure S2: Classification of the test set structures into the top four ECOD structural levels (from the center out): architecture (A), possible homology (X), homology (H), and topology (T). The names of the architecture types are shown in the outer circle of the diagram. Branches drawn in black correspond to groups that have representatives in both training and test sets. Branches drawn in grey correspond to groups unique to the test set. Four architecture groups present overlap at all levels between the training and test sets: "a/b barrels", "beta duplicates or obligate multimers", "a+b complex topology", and "a+b four layers". We do not show the F-groups because they have litle overlap among the training and test sets. Targets T0773, T0797, and T0816 are excluded from the analysis because they have no ECOD classification, and targets T0820, T0823, T0824, T0827, T0835, and T0836 are excluded because they have no structure in the RCSB PDB.

Table S3: Details of the model architecture. Layer 10 is marked with an asterisk to indicate that its output is used in the Grad-CAM analysis reported in Section III.B of the main text.

Layer	Type	Input dimensions	Output dimensions	Parameters
1	3D Convolution	$11 \times 120 \times 120 \times 120$	$16 \times 118 \times 118 \times 118$	Filter size $3 \times 3 \times 3$, stride 1
2	ReLU			
3	Max pooling	$16 \times 118 \times 118 \times 118$	$16 \times 58 \times 58 \times 58$	Filter size $3 \times 3 \times 3$, stride 2
4	3D Convolution	$16 \times 58 \times 58 \times 58$	$32 \times 56 \times 56 \times 56$	Filter size $3 \times 3 \times 3$, stride 1

33	Linear	128	1	

Training procedure

Rotations

The rotations were sampled in the following way:

1. Select three random uniform values $u_1, u_2, u_3 \in [0, 1]$
2. Construct quaternion from them

$$q_0 = \sqrt{(}1 - u_1) \sin(2\pi u_2) \tag{1}$$
$$q_1 = \sqrt{(}1 - u_1) \cos(2\pi u_2) \tag{2}$$
$$q_2 = \sqrt{(}u_1) \sin(2\pi u_3) \tag{3}$$
$$q_3 = \sqrt{(}u_1) \cos(2\pi u_3) \tag{4}$$

3. Construct the corresponding rotation matrix

Translations

The translations were sampled according to the following algorithm:

1. Compute the bounding box of the atoms in the decoy
2. Translate the protein so that the center of the bounding box corresponds to the frame origin
3. Rotate protein using random uniform rotation
4. Calculate the maximum shift along each axis:

$$D_k = \tfrac{1}{2} \max \left[0, \tfrac{1}{2} S_k - \tfrac{1}{2} B_k\right], \quad k \in x, y, z$$

   where S_k are input size along the axes x,y,z and B_k are the bounding box sizes along the same axes.

5. Sample random uniform translation along each axis from the interval $[-\frac{1}{2} D_k, \frac{1}{2} D_k], k \in x, y, z$

Training parameters

The loss function is optimized using the Adam algorithm [**?**], with a learning rate of 0.0003 and a learning rate decay of 0.01.

Figure S3: Scoring funnels on the validation set using the 3DCNN model from epoch 40. The x-axis is the GDT_TS score and the y-axis is the s score of a decoy. The score for each decoy was computed once during each epoch of the training.

Figure S4: Distribution of the score of decoy FALCON_EnvFold_TS1 for target T0832 under random translations and rotations. The distribution fits a normal distribution with an average $\mu = 2.74$ and a standard deviation $\sigma = 0.37$ (shown in green dashed lines). The figure also shows the distributions of the score under rotations only (red lines) and under translations only (black dashed lines).

Figure S5: Scoring funnels on stage 1 CASP11 targets. The x-axis is the GDT_TS score and the y-axis is the s score. The score mean is shown with blue dots and the standard deviation with red error bars.

Figure S6: Scoring funnels on stage 2 CASP11 targets. The x-axis is the GDT_TS score and the y-axis is the s score. The score mean is shown with blue dots and the standard deviation with red error bars.

Figure S7: Left: Output of the Grad-CAM analysis for layer 10 of the network projected on candidate structure Distill_TS3 of target T0776. The isosurface shows the scaled outputs at the two-sigma level. The intensities of the outputs at the positions of the protein atoms are color-coded on the cartoon rendering of the structure, from blue (low intensity) to red (high intensity). Right: Cartoon representation of the Distill_TS3 decoy structure (in blue) aligned to the native structure (in red).

Table S4: (Next page) Output of the Grad-CAM algorithm on representative decoys from the CASP11 test set stage 2. For each target, decoys are divided into four GDT_TS binds of equal width, and one decoy is selected from each bin. The rightmost column shows the native structure. The Grad-CAM output map of each decoy is generated from 30 inputs rotated and translated at random. The 30 output maps are projected on the atoms of the decoys, and the average values of the projections are plotted using Pymol with the "rainbow" color scheme. The 3DCNN score is reported as "average ± standard deviation" over the 30 inputs.

Table S5: Performance comparison of our method (3DCNN) with other state-of-the-art MQA methods on the CASP12, CAMEO, 3DRobot datasets. The table reports the absolute, per-target average values of the correlation coefficients. The CASP12 targets were taken from the December 2, 2017 update and the CAMEO targets were taken from the 6-month period prior to December 10, 2017. CASP12 and CAMEO datasets were optimized with SCWRL4 program prior to scoring.

MQA method	Loss (Eq. 11)	Pearson R	Spearmann ρ	Kendall τ
		CASP12		
3DCNN	0.146	0.607	0.521	0.381
VoroMQA	0.161	0.557	0.515	0.380
RWplus	0.192	0.313	0.355	0.257
		CAMEO		
3DCNN	0.060	0.586	0.532	0.426
VoroMQA	0.099	0.456	0.427	0.346
RWplus	0.162	0.122	0.095	0.068
		3DRobot		
VoroMQA	0.038	0.891	0.859	0.678
RWplus	0.076	0.844	0.829	0.651
3DCNN	0.083	0.856	0.839	0.652

Figure S8: 3DCNN score versus GDT_TS for the two most correlated targets and the two least correlated targets in the 3DRobot benchmark.
